

Being Onboarded

- Reverse proxies (middle ware) are generally used to mitigate which users have access to the contents inside the database.
This is what's commonly called the back-end.
- How the database interacts with rest of the app is also something to be concerned about upon being onboarded.
This is often overlooked by many developers that just got into the industry.
- Get an understanding of how the CI/CD is done at the software shop.
- Take a look at how one's workflow is like, shadow someone.

Graduate Thesis

- More often than not, your program will want you to maintain certain amount of GPA. The school I went to wanted all their students to maintain GPA of 3.0.
- You don't necessarily need to have a thesis in mind before choosing your advisor because they will spoon feed you if you don't have any idea; however, it's better if you do because, more often than not, your advisor will lead you to some where that's completely bogus.
